Komatsu WA380-6H shop manual. 1296 pages serial number H60051 and up

Komatsu General Atomics Engineering Corporation* in 1998 introduced a technology developed in the U.S. designed to clean soil contaminated with heavy metals, and since then has successfully expanded its activities in the cleanup business. This metal-contaminated soil-treatment technology turns toxic heavy metals, which are present in the soil, into a water-insoluble, nontoxic mineral as an apatite. In this way, they are prevented from leaching into and contaminating external media. One of the typical apatite minerals is apatite hydroxide $\text{Ca}_5(\text{PO}_4)_3\text{OH}$. Metals with positive ions, such as lead (Pb), can infiltrate the apatite hydroxide structure replacing calcium (Ca), thus turning the apatite into $\text{Ca}_{5-n}\text{Pb}_n(\text{PO}_4)_3\text{OH}$ (where n is 5 or less).
