JD John Deere 4010 4020 Tractor Service Manual in the technological know-how of archaeology. The man or woman sorts of excavation are regarded simply as digs to people who participate in, with this being an over literal description of the technique used. An excavation issues itself with a particular archaeological web page or associated collection of web sites, and can be carried on over a amount of years, thinking about that the paintings can normally instances typically be of a seasonal nature. **JD John Deere 4010 4020 Tractor Service Manual**

Inside of the enterprise of excavation, many lots greater strategies can be utilized, with each unmarried dig acquiring its very own precise traits which could necessitate variations of technique. Methods and different sensible problems do not permit archaeologists to carryout excavations each time and anyplace they choose, as many regarded web sites have additionally been intentionally left on my own and non excavated.

At first, excavation requires the eliminating any topsoil this is found with the aid of using an excavator machine. What is dug up can be reviewed with the aid of using a metallic detector for

## TO THE JOHN DEERE SERVICEMAN

This service manual contains maintenance instructions for John Deere 4000 Series Wheel Tractors. Included are complete instructions for removal, disassembly, inspection, repair, assembly and installation of the major parts and assemblies of the tractor.

In addition, the manual contains brief descriptions of the more complicated systems of the tractor, and tells how they operate.

In Section 20, "Specifications," dimensions of many new wearing parts are given as an aid in determining when parts replacement is necessary.

A section on "Tune-Up and Adjustment" contains instructions for performing the services necessary to help the tractor perform efficiently and economically after it has been in the field for some time.

This manual was planned and written for the Service Department; its place is in the shop. Use the manual whenever in doubt about correct maintenance procedures. Use it as a text book for training new Service Department personnel who are unfamiliar with John Deere Tractors.

Daily use of the Service Manual as a guide for any and all service problems will reduce error and costly delay to a minimum and assure you the best in finished service work. In many instances your customer's confidence in your work will be improved when he sees you using the Service Manual. He knows you are following approved maintenance procedures and making proper adjustments. There is no guesswork when you use the manual.

*John Deere 4010 Wheel Tractor (Gasoline Engine)*

## Section 10

# DESCRIPTION, OPERATION, AND SPECIFICATIONS

### Group 5

## DESCRIPTION

*Fig. 10-5-1—John Deere 4010 Wheel Tractor (Diesel Engine)*

The John Deere 4010 is a heavy-duty wheel tractor designed to operate with industrial equipment such as bulldozers, loaders, and backhoes, and to perform various pulling or hauling operations on construction projects.

The tractor is available with either a gasoline or a diesel engine. With the exception of the engines the majority of the tractor parts and components are identical.

The features of the tractor are described briefly in the paragraphs which follow. Full descriptions of each of the assemblies are given in the various sections throughout this manual.

### SERIAL NUMBERS

Each engine bears a serial number on the generator mounting pad on the front right side of the cylinder block.

The tractor serial number is located to the right of the center link attaching bracket on the rear of the transmission case.

### MODEL NUMBERS

The distributor, fuel injection pump, main hydraulic pump, rockshaft housing, and remote cylinder selective control valve housings each bear a model number.

**ENGINE**

Both the gasoline and diesel variable-speed engines have six in-line cylinders and develop up to 80 horsepower (maximum observed) measured at the PTO at 2200 engine rpm. See Section 50 for additional information.

**CRANKCASE VENTILATING SYSTEM**

Crankcase ventilation is accomplished by a liquid seal, impeller-type pump. See Section 70.

**CLUTCH ASSEMBLIES**

The transmission and PTO clutch assemblies are located in a recess in the rear of the engine flywheel.

The spring-loaded type transmission clutch is operated by a pedal on the left side of the tractor.

The PTO clutch is operated by a lever at the left side of the tractor cowl and locks into the engaged or released position.

The clutches are described in detail in Section 110.

**FUEL SYSTEM**

The large capacity fuel tank is located at the front of the tractor just ahead of the radiator.

A fuel pump, driven from the camshaft, and provided with a sediment bowl and screen assures a constant supply of clean fuel to the gasoline carburetor or the diesel injection pump.

A large-capacity fuel filter, connected between the fuel pump and the injection pump, filters the diesel fuel before it enters the injection pump. The filter contains two replaceable micron filtering elements.

A screen in the carburetor provides additional filtering of the gasoline.

See Sections 90 and 100 for details.

**ELECTRICAL SYSTEM**

Diesel-engine-powered tractors use a 24-volt, split-load type electrical system. A 24-

volt generator with a three-unit regulator supplies current for the electrical load and to maintain the charge in two 12-volt batteries. The current in this part of the system is carried entirely by wires, using no part of the tractor frame as a conductor.

Tractors with gasoline engines use the 12-volt grounded-type system. Current is provided by a 12-volt generator. Generator output is controlled by a three-unit regulator.

Lighting and accessory circuits are of the grounded type, using current at 12 volts.

Starting motors with enclosed solenoid shift are used to crank the engines.

See Section 200 for additional information.

**IGNITION SYSTEM**

Gasoline engines are equipped with battery ignition systems. The distributor, located at the right rear of the engine block, is driven at one-half engine speed from the camshaft. The distributor has a centrifugal advance system.

The ignition system is of the bypass type using current at 12 volts while cranking the engine to improve starting. After cranking ceases, a resistor reduces the voltage to 6 volts to supply the 6-volt ignition coil.

See Section 200 for details.

**COOLING SYSTEM**

The tractor has a pressure-type cooling system with a centrifugal-type pump to provide circulation of the coolant. Two thermostats maintain constant coolant temperature.

When the thermostats are closed, a bypass allows circulation of the coolant through the engine without passing through the radiator.

This feature allows the engine to reach operating temperature in a shorter length of time. When the coolant reaches operating temperature, the thermostats open allowing circulation of coolant through the radiator to maintain a constant operating temperature.

Section 80 contains detailed information.

## TRANSMISSION

The tractor is equipped with a collar-shift transmission with four shift "stations."

The transmission, which has eight forward and three reverse speeds, is shifted by a shift lever located at the right side of the instrument panel. Shifting from low to high or high to reverse can also be accomplished, within stations, by a lever located at the left side of the instrument panel.

Helical cut gears are used in all transmission speeds.

An oil cooler is provided to maintain the transmission oil temperature at a satisfactory level. See Section 130 for details.

## DIFFERENTIAL AND FINAL DRIVE

Conventional spiral bevel ring gear and pinion drive is used in the tractor. A planetary gear assembly provides the final gear reduction in the drive gear train. This design reduces strain on the transmission gear train. See Sections 160 and 170.

## POWER TAKE-OFF (PTO) AND BELT PULLEY

Tractors can be purchased with or without both front and rear PTO. The rear PTO is adaptable to 540 or 1000 rpm by use of an adapter furnished with the PTO. The front PTO operates at 1000 rpm only. The PTO clutch operating lever is located to the left of the tractor cowl.

A belt pulley is available for mounting on the rear PTO. The 12-inch pulley gives 3035 fpm belt speed at 1900 rpm engine speed. Instructions for belt pulley and PTO are given in Section 180 of this manual.

## DRAWBAR

The tractor is equipped with either a regular or wide swing drawbar. The regular drawbar is used on tractors equipped with rear rockshaft and 3-point hitch. Instructions for using the drawbar are included in Section 320 of this manual.

## FRONT AXLE

The tractor is equipped with a heavy-duty, non-adjustable front axle. For details see Sections 220 and 230 of this manual.

## REAR WHEELS

Heavy-duty rear wheels are attached to the rear axles with no provision for adjustment. However, optional rims can be obtained to provide a rear wheel tread of either 70 or 86 inches. For detailed information, see Section 230 of this manual.

## SEATS

The tractor can be equipped with either the regular seat or an optional deluxe seat. The regular seat is cushioned by no-sag springs and foam padding, while the deluxe seat uses a steel compression spring and shock absorber to provide "Float-Ride" suspension. The deluxe seat is also equipped with a flexibly-mounted, padded back rest and semi-circular foampadding which surrounds the operator. Refer to Section 210.

## HYDRAULIC SYSTEM

The tractor Hydraulic System is pressurized by a constant-running variable-displacement hydraulic pump as regular equipment. The pump is mounted below and ahead of the radiator and is driven at engine speed from the crankshaft. The hydraulic pump supplies oil under pressure to operate the power steering, power brakes, rear rockshaft and remote hydraulic cylinders.

The hydraulic system is constant pressure, closed center and "live"; that is it can be operated when the engine is running, whether the tractor is moving or not. The system can be equipped with either one or two selective control valves and breakaway couplers for operation of remote cylinders.

The single selective control valve operates one remote cylinder only. Two selective control valves permit use of two remote cylinders, which can be operated either separately or simultaneously. The cylinders can be either single or double acting.

The tractor can also be equipped with a rear rockshaft to hydraulically control integral equipment to best advantage.

See Sections 240 through 310 for additional information.

### STEERING

Hydraulic power steering is regular equipment on the tractor. Movement of the steering wheel actuates a steering valve which directs a flow of pressure oil to the two steering cylinders which turn the front wheels. In case of pressure oil failure, the tractor can be steered manually. Complete information is given in Section 270.

### POWER BRAKES

The power brakes are operated by pedals located at the right side of the operator's platform. The brakes can be applied independently or simultaneously. The brake pedals can be locked together for simultaneous operation if desired. The hydraulically powered, disk-type brakes operate in oil. In case of pressure oil failure, the brakes will operate much the same as conventional hydraulic brakes. Refer to Section 280 for additional information.

# Excavator Service Repair Manual

stray unearths however except the excavation web page has persevered to be untouched for a prolonged duration of time, there's a tiny layer of present day fabric at the floor this is of constrained archaeological interest.

In farm areas, any form of archaeological attributes need to be apparent underneath the floor. With city areas, they'll be thick layers of human deposits and simplest the uppermost may be seen to the bare eye. With both case, the first actual project is drawing a scaled web page plan which could display the rims of the excavation. This approach may be composed the usage of tape measures, or as it is greater not unusualplace those days, an digital general station. A grid is normally set up, to divide the web page.

Excavation is moreover beneficial for digging out homes and ditches. When clearing dust out for roads or sub divisions, excavation is what looks after matters. Even alevn though there are some means, the time period excavation is used each time that the earth or dust is disturbed. Heavy equipment is likewise very not unusualplace with excavation, consisting of excavator machines or backhoes. Excavating crews run the system and dig up soil and rocks for regardless of the cause can be. Excavator machines are the maximum normally used equipment, as they could flow some of dust in a touch little bit of time.

Anytime you're collaborating in excavation, you need to continually use clever practices and be safe. If you intend to get down right into a hollow or trench, you need to continually use a trench box. Even alevn though the hollow won't be that deep, excavation web sites can regularly give way and at that point - matters are very risky and probably even deadly. For digging up uncommon artifacts or installing homes or roads, excavation is a few aspect that has been round for years and years. There can be lots to discover with excavation, as you will want to discover the satisfactory manner to run an excavator machine, shoot grade, and simply a way to nicely dig holes and ditches in order that they might not give way.
